Abstracts

Insulated metal substrate (IMS) consists of a metal baseplate (aluminium is commonly used because of its low cost and density) covered by a thin layer of dielectric (usually an epoxy-based layer) and a layer of copper (35 μ m to more than 200 μ m thick). The FR-4-based dielectric is usually thin (about 100 μ m) because it has poor thermal conductivity compared to the ceramics used in DBC substrates. Due to its structure, the IMS is a single-sided substrate, i.e. it can only accommodate components on the copper side. In most applications, the baseplate is attached to a heatsink to provide cooling, usually using thermal grease and screws. Some IMS substrates are available with a copper baseplate for better thermal performances. Compared to a classical printed circuit board, the IMS provides a better heat dissipation. It is one of the simplest ways to provide efficient cooling to surface mount components. The Insulated Metal Substrates industry can be broken down into several segments, Copper Based, Aluminum Based, etc. The core manufacturers of Insulated Metal Substrates in the world include AT&S, KinWong, Aismalibar, NHK, Shengyi, etc. The top five companies have about 62% of the market. Asia-Pacific region is the world's largest Insulated Metal Substrates market with a market share of about 55%, followed by Europe and North America with a market share of 21% and 19%, respectively. In terms of product type, Aluminum Based is the largest segment with approximately 46% market share. In terms of application, Lighting Application is the largest application, accounting for about 43% of the market share.

The global Insulated Metal Substrates market size was estimated at USD 839.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
