Report Overview

Insulating concrete form or insulated concrete form (ICF) is a system of formwork for reinforced concrete usually made with a rigid thermal insulation that stays in place as a permanent interior and exterior substrate for walls, floors, and roofs. The forms are interlocking modular units that are dry-stacked (without mortar) and filled with concrete. The units lock together somewhat like Lego bricks and create a form for the structural walls or floors of a building. ICF construction has become commonplace for both low rise commercial and high performance residential construction as more stringent energy efficiency and natural disaster resistant building codes are adopted. ICFs may be used with frost protected shallow foundations (FPSF).

The North American region is the largest consumer of insulating concrete form products. The US, Canada, and Germany are among the major markets for insulating concrete form. The insulating concrete form market in North America is projected to grow at the highest CAGR during the forecast period. Increasing number of residential activities in the US, Canada, and Mexico is projected to drive the growth of the North America insulating concrete form market. Additionally, government investments in the construction sector provide potential growth opportunities for the insulating concrete form market in this region.
