Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Insulating Riser Sleeves for Casting competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Insulating Riser Sleeves for Casting is a casting auxiliary component made of insulating material and placed over the riser. It is used to delay the solidification of the molten metal within the riser, ensuring sufficient shrinkage compensation for the casting, improving casting quality and process yield. Made of a low-thermal-conductivity material, its inner wall profile mirrors the riser's, effectively preventing defects such as shrinkage cavities and porosity in castings. The raw materials for insulating riser sleeves for casting mainly include insulation materials. The insulation material is usually low thermal conductivity aluminum silicate ceramic fiber, and sometimes rock wool, asbestos or glass fiber are also used. The downstream market is mainly for industries such as automobiles, machinery manufacturing, and energy. The market demand is highly correlated with the prosperity of the foundry industry. In 2024, the global production was about 136,000 tons, and the average market price was about US\$2,750/ton. The gross profit margin of major companies in the industry is about 25% to 35%. The annual production capacity of a single line is about 30,000-100,000 tons/year due to different levels of process automation.

The global Insulating Riser Sleeves for Casting market size was estimated at USD 374.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
