Abstracts

Integrated atomic absorption spectrophotometer is an important equipment tool for trace and trace element analysis in modern scientific research and industrial production. It works based on the Lambert-Beer law and the principle of atomic absorption of specific light. When the characteristic radiation emitted by the light source passes through the atomic vapor of the element to be measured, the ground state atoms in the vapor will absorb the characteristic radiation and transition from the ground state to the excited state. The intensity of the absorbed radiation is proportional to the concentration of the ground state atoms of the element to be measured in the vapor. By measuring the degree of absorption of the characteristic radiation, the content of the element to be measured can be inferred. The integrated atomic absorption spectrophotometer has the characteristics of high-precision analysis, integrated design, convenient data management, safety and reliability, and strong scalability. It is widely used in chemical, metallurgical, petroleum, pharmaceutical, agricultural, environmental protection, food and other industries.

The global Integrated Atomic Absorption Spectrophotometer market size was estimated at USD 427.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
