Report Overview

Integrated circuit testing equipment mainly includes testing machines, sorting machines, and probe tables. Testing machines are specialized equipment for detecting chip functionality and performance. Sorting machines and probe tables are specialized equipment that connect the tested chips and wafers with the functional modules of the testing machine and achieve batch automated testing. The sorter is mainly used in the verification link in the integrated circuit design stage and the finished product test link in the packaging test stage. Its main purpose is: the sorter automatically transmits the chip to be tested to the test station (used to connect the chip to the test machine and test the position), and the pin of the chip to be tested is connected to the functional module of the test machine through the special connection line on the test station, After testing, the testing machine transmits the test results to the sorting machine, which marks, classifies, and receives the detected chips based on the test results.
