Abstracts

Cloud email security encompasses a broad range of services and technologies designed to safeguard email communications in cloud environments. It includes various solutions that protect against email-borne threats, such as spam, phishing, malware, and ransomware. Integrated cloud email security (ICES) is a type of email security solution that supplements cloud-based email services, such as Microsoft Office 365, Google Workspace, or Amazon WorkMail. An ICES solution provides advanced email protection against a wide range of threats, including spam, phishing, malware, and ransomware. Integrated Cloud Email Security (ICES) is a cloud-based approach to email security that enhances and complements traditional Secure Email Gateways (SEGs). ICES solutions provide advanced threat protection, including the detection and remediation of sophisticated threats that traditional SEGs might miss. ICES was the security response to the exponential growth of email attacks alongside the rapid increase in cloud email adoption. With a true ICES solution, companies have deep visibility into email communications, and a real-time defense against advanced threats.

Role of artificial intelligence (AI) in ICES. Machine learning (ML): Enables the ICES system to learn and improve from experience without being explicitly programmed. ML algorithms continuously analyze email traffic and vast amounts of data, learning from patterns and behaviors, allowing for both proactive and adaptive threat detection in real time.

Natural language processing (NLP): Analyzes email content for linguistic threat indicators. NLP enables machines to understand, interpret, and respond to human language. This AI layer examines the text data in the email content for cues like malicious language, suspicious keywords, and grammar inconsistencies. For example, it will look at language patterns indicative of urgency or fear, which is common in phishing emails, or flag requests for sensitive information or financial transactions.

Social graph analysis: Evaluates the context of communications throughout the company. This observes interactions between users and creates relationship and

communication maps of the network. These maps allow the system to identify influential users and understand the normal email dynamics of the network. By mapping who talks to whom, ML detects impersonation attempts or abnormal communication. For example, an email claiming to be from a CEO but sent from a domain not typically associated with the executive is flagged as potential fraud.
