Abstracts

Integrated display chips, also known as integrated graphics processing units (GPUs), are semiconductor components embedded within a computer's central processing unit (CPU) or system-on-a-chip (SoC) that handle graphical rendering and display output without requiring a separate, dedicated graphics card. These chips share system memory with the CPU and are optimized for energy efficiency, cost-effectiveness, and space-saving designs, making them suitable for devices where high graphical performance is not a primary requirement, such as entry-level laptops, office desktops, tablets, and embedded systems. Unlike discrete GPUs, integrated solutions prioritize thermal management and power conservation over raw graphical throughput, supporting everyday computing tasks, video playback, and light multimedia applications rather than intensive gaming or professional visual workloads.

The global Integrated Display Chip market size was estimated at USD 2500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
