Abstracts

The integrated drug discovery algorithm platform is a comprehensive tool platform that integrates multiple computational methods, data mining technologies and artificial intelligence algorithms. It aims to accelerate the decision-making efficiency and success rate of key links in the new drug development process, from target identification, lead compound screening, molecular optimization to drugability prediction. The platform integrates multiple functional modules such as virtual screening (such as molecular docking and pharmacophore analysis), molecular generation and optimization (such as molecular generation models based on graph neural networks), ADMET property prediction, protein structure modeling (such as AlphaFold), retrosynthetic path planning, literature mining, etc., to build a full-process "computation-driven drug discovery" architecture. Users can process high-throughput data, optimize and redesign candidate molecules through a visual interface, API interface or automated workflow, greatly shortening the R&D cycle and reducing experimental costs. Such platforms are widely used in pharmaceutical companies, biotechnology companies, research institutes and CRO institutions, especially in early drug screening and structure optimization, and are becoming a key infrastructure in the drug discovery process.

The global Integrated Drug Discovery Algorithm Platform market size was estimated at USD 1611.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.10% during the forecast period.
