Report Overview

Valve jet printers are built with internal jets that are used to pressurize and propel ink droplets toward substrates. These jets are controlled by valves that alternatively open and close to create varying levels of pressure and oscillate an ink stream into different droplet sizes. Once a substrate passes by the valve jet printhead, the pressurized droplets are expelled toward the material to create the text or code. This operating principle allows valve jet printers to create continuous ink flows, which is ideal for industrial coding applications that require prolonged periods of uptime. Additionally, valve jet printer operating costs are relatively low, making them a great fit for variable data printing on porous and non-porous substrates.
