Abstracts

An intelligent driving technology solution is a comprehensive approach designed to achieve automated vehicle operation, primarily encompassing two mainstream modes: the pure vision system and the lidar system. The pure vision solution relies on cameras to capture image data and, with the support of algorithms, is widely used in L2 and L3 levels of assisted driving. Due to its low cost and broad application scope, it has become the mainstream choice. The lidar solution emits laser beams for three - dimensional modeling and distance measurement, excelling in complex environmental perception and enabling a higher level of autonomous driving functions. However, the two solutions perform differently in real-world road conditions. The pure vision system is affected by factors such as lighting, while the lidar system has drawbacks in adverse weather conditions and high costs.

The global Intelligent Driving Technology Solution market size was estimated at USD 2516.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.00% during the forecast period.
