Abstracts

Inter-row air conditioners are precision refrigeration equipment designed specifically for high-heat-density environments such as data centers and server rooms. By deploying air conditioning modules directly between rows of IT cabinets, they can achieve precise air supply at close range and efficient circulation of hot and cold airflow. Its core advantage is to shorten the cold air delivery path and significantly reduce energy consumption (saving 30%-40% energy compared to traditional air conditioners). At the same time, it adopts a modular design, which can be flexibly expanded and adapted to the high-power heat dissipation requirements of more than 5kW for a single cabinet. It cooperates with the intelligent temperature control system to adjust environmental parameters in real time, effectively solving the problem of local hot spots, and has become the mainstream heat dissipation solution for modern high-density computer rooms.

The global Inter-row Air Conditioner market size was estimated at USD 1877.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.70% during the forecast period.
