## Abstracts

An Interdigitated Microelectrode (IME) is a microfabricated electrode structure consisting of interwoven, comb-like conductive fingers that enhance electrochemical interactions. Due to their high surface-area-to-volume ratio and short diffusion paths, IMEs improve sensitivity and response times in applications such as biosensors, electrochemical analysis, and impedance spectroscopy. They are commonly used in biomedical diagnostics, environmental monitoring, and microfluidic systems for detecting chemical and biological substances. Their design allows for precise signal amplification, making them ideal for miniaturized and high-performance sensing technologies.

The global Interdigitated Microelectrode (IME) market size was estimated at USD 106.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
