### Report Overview:

Interferometric synthetic aperture radar, abbreviated InSAR, is a radar technique used in geodesy and remote sensing. This geodetic method uses two or more synthetic aperture radar (SAR) images to generate maps of surface deformation or digital elevation, using differences in the phase of the waves returning to the satellite or aircraft. The technique can potentially measure millimetre-scale changes in deformation over spans of days to years. It has applications for geophysical monitoring of natural hazards, for example earthquakes, volcanoes and landslides, and in structural engineering, in particular monitoring of subsidence and structural stability.

The Global Interferometric Synthetic Aperture Radar (InSAR) Market Size was estimated at USD 299.18 million in 2023 and is projected to reach USD 728.93 million by 2029, exhibiting a CAGR of 16.00% during the forecast period.
