Abstracts

Intergranular Corrosion (IGC) Testing Service refers to a specialized material testing process used to evaluate the susceptibility of metallic materials—particularly stainless steels and certain nickel-based alloys—to corrosion along grain boundaries. This type of corrosion occurs when chromium carbides or other precipitates form at the grain boundaries during improper heat treatment or welding, leading to localized attack in corrosive environments. IGC testing services use standardized methods such as ASTM A262, ASTM G28, or ISO 3651 to expose samples to specific chemical environments that accelerate intergranular corrosion, allowing assessment of a material's corrosion resistance. These services are crucial in industries like aerospace, nuclear, petrochemical, and marine engineering, where material integrity and long-term durability are critical. The test results help manufacturers ensure compliance with material specifications, prevent failure in service, and validate the effectiveness of heat treatment and alloy composition.

The global Intergranular Corrosion Testing Service market size was estimated at USD 1058.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
