Abstracts

An intermittent checkweigher is a specialized industrial weighing system designed for batch processing applications where products are manually or semi-automatically placed on the weighing platform at irregular intervals rather than continuously moving on a conveyor. It operates by pausing the weighing process to measure the mass of individual items or batches with high precision before allowing the operator to remove the weighed product and place the next one. These systems are commonly used in industries such as food processing, pharmaceuticals, and logistics for quality control, portion control, compliance with regulatory standards, and inventory management, offering flexibility for low-to-medium throughput environments where continuous motion is not feasible or necessary.

The global Intermittent Checkweigher market size was estimated at USD 190.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
