Abstracts

Internal bonded post-tensioning systems involve the use of steel tendons placed within ducts embedded in the concrete. After the concrete cures, the tendons are tensioned using hydraulic jacks. The tendons are then bonded to the concrete through the use of grout, which fills the ducts and secures the tendons in place. This bonding creates a continuous, integrated system where the tendons and concrete work together to resist loads. Internal bonded post-tensioning is commonly used in building floors, bridges, and other structures where high strength and durability are required, helping to minimize cracking, reduce deflections, and increase load-bearing capacity.

The global Internal Bonded Post-Tensioning Systems market size was estimated at USD 249.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
