Abstracts

The crankshaft is the heart of the internal combustion engine. The crankshaft is made of carbon structural steel or ductile iron. The crankshaft is one of the five core components of the internal combustion engine (cylinder block, cylinder head, crankshaft, connecting rod, camshaft). During the operation of the engine, the crankshaft cooperates with the connecting rod to convert the gas pressure generated by fuel combustion and acting on the piston into the torque of the crankshaft, which is transmitted to the transmission mechanism, valve mechanism and other auxiliary devices of the chassis through the flywheel to achieve Power output. The performance of the crankshaft (precision, stiffness, wear resistance, etc.) determines the working performance and working life of the entire internal combustion engine to a large extent, and has an important impact on vehicle performance, fuel economy, and environmental emissions.

The global Internal Combustion Engine Crankshaft market size was estimated at USD 2548.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of -3.45% during the forecast period.
