## Abstracts

An internal concrete vibrator is a tool used to consolidate concrete during the pouring process. It is also known as an immersion vibrator or a poker vibrator. The vibrator consists of a vibrating or poker, which is attached to a motor or an electrically driven mechanism. The head of the vibrator is immersed into the fresh concrete, and the vibrations generated help to eliminate air pockets and ensure proper compaction of the concrete. There are various types of internal concrete vibrators available, including high-frequency, electric, and pneumatic models. The choice of vibrator depends on factors such as the size of the concrete pour, the type of concrete being used, and the required level of compaction. Internal concrete vibrators are commonly used in construction projects, such as the construction of buildings, bridges, and dams. They are essential tools for achieving strong, durable, and void-free concrete structures.

The global Internal Concrete Vibrator market size was estimated at USD 152.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
