## Abstracts

Internal post-tensioning systems are a type of structural reinforcement used in concrete construction, where steel tendons (cables or bars) are placed inside ducts or sleeves embedded within the concrete. After the concrete has hardened, the tendons are tensioned (stretched) using hydraulic jacks, creating compressive forces that strengthen the concrete. This technique helps control cracking, reduce the size of beams and columns, and improve the overall structural performance of buildings, bridges, and other concrete structures. Internal post-tensioning is commonly used in slab-on-grade foundations, parking garages, high-rise buildings, and bridges. It allows for thinner, lighter concrete structures while enhancing durability and resistance to bending or stretching. The system is effective in improving load-carrying capacity and minimizing deflection.

The global Internal Post-Tensioning Systems market size was estimated at USD 736.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
