Abstracts

Internal unbonded post-tensioning systems use steel tendons placed inside ducts within the concrete, but unlike bonded systems, the tendons are not permanently anchored to the concrete. The tendons are coated with a protective grease or sheathing to prevent corrosion and are free to move within the ducts. After the concrete hardens, the tendons are tensioned using hydraulic jacks, creating compressive forces that enhance the structure's strength. This system allows for easier tendon replacement or adjustment, making it ideal for long-span structures like bridges or large slabs. It offers high durability and flexibility in design, especially in structures subjected to high stress.

The global Internal Unbonded Post-Tensioning Systems market size was estimated at USD 524.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
