Abstracts

The Internally Circulating Fluidized Bed Gasification System is a thermochemical process that converts solid fuels (such as biomass, coal, or waste) into syngas by utilizing a dual-zone fluidized bed design. It combines a dense-phase combustion zone with a lean-phase gasification zone within the same reactor, allowing in-situ recirculation of hot bed materials (e.g., sand or ash). This internal circulation facilitates efficient heat transfer, promotes uniform temperature distribution, and supports stable endothermic gasification reactions without external heat sources.

The global Internally Circulating Fluidized Bed Gasification System market size was estimated at USD 177.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
