Report Overview

An internally fused capacitor is a specially designed capacitor with an integrated fuse as an additional overcurrent protection device. Generally, capacitors may be affected by overload current during operation. Without appropriate protection measures, overload may cause capacitor damage or failure. To prevent this from happening, internally fused capacitors are designed with a fuse inside them that breaks the circuit in the event of an overcurrent, preventing the capacitor from being damaged. This design can enhance the safety and reliability of the capacitor, protect the capacitor from damage by overload current, and extend its service life. Internally fused capacitors are commonly used in a variety of circuits, especially in applications where additional protection of the capacitor is required.

The global Internally Fused Capacitor market size was estimated at USD 188 million in 2023 and is projected to reach USD 354.45 million by 2032, exhibiting a CAGR of 7.30% during the forecast period.
