### Report Overview

Interventional Heart Valve refers to a medical device used in minimally invasive procedures to treat heart valve diseases. It is a revolutionary alternative to traditional open-heart surgery, providing a less invasive and more efficient treatment option for patients. The Interventional Heart Valve is typically made from biocompatible materials such as metal alloys, polymers, or animal tissue. It is designed to replace a damaged or diseased heart valve without the need for a large chest incision or cardiopulmonary bypass. The valve is compressed and inserted into the body through a small incision, often in the groin or chest, and guided to the site of the diseased valve. During the procedure, the Interventional Heart Valve is expanded or deployed in place of the native valve, effectively restoring proper blood flow and functionality. Some types of Interventional Heart Valves are self-expanding, while others may require the assistance of a balloon catheter for deployment. This innovative technology offers several advantages over traditional open-heart surgery. It significantly reduces the risks associated with major surgery, such as infection, blood loss, and long recovery times. Patients benefit from shorter hospital stays, quicker rehabilitation, less pain, and improved quality of life. Interventional Heart Valves are primarily used to treat conditions such as aortic stenosis or mitral regurgitation, where the aortic or mitral valve is not functioning properly. These technologies continue to evolve, with ongoing research and development aimed at improving durability and long-term outcomes. The market prospect for Interventional Heart Valves is promising, driven by the increasing prevalence of heart valve diseases and the desire for less invasive treatment options. Moreover, advancements in technology and the growing expertise of interventional cardiologists contribute to the expanding adoption of these devices. Manufacturers and medical professionals in the field continue to innovate and refine Interventional Heart

Valves, providing patients with improved outcomes and better overall cardiac care.
