Abstracts

Interventional lung disease refers to a specialized medical field utilizing minimally invasive techniques?such as bronchoscopy, thoracoscopy, or image-guided procedures?to diagnose and treat a range of pulmonary conditions, including lung cancer, chronic obstructive pulmonary disease (COPD), severe asthma, pleural effusions, and airway obstructions. This discipline integrates advanced technologies like robotic-assisted bronchoscopy, navigational platforms, endobronchial ultrasound (EBUS), and various therapeutic tools (e.g., stents, valves, cryotherapy, or laser ablation) to offer precise, targeted interventions that reduce patient trauma, shorten recovery times, and improve outcomes compared to traditional surgical approaches. The scope of interventional lung disease continues to expand as innovations in imaging, biomarker identification, and personalized medicine enable earlier diagnosis, more effective localized treatments, and management of complex thoracic diseases in patients who may be high-risk candidates for surgery.

The global Interventional Lung Disease market size was estimated at USD 1085.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
