Abstracts

Interventional X-ray devices are specialized medical imaging systems designed to guide minimally invasive procedures, such as angioplasty, stent placement, embolization, and biopsies, by providing real-time, high-resolution fluoroscopic visualization of anatomical structures, instruments, and contrast agents during surgical interventions. These systems integrate advanced features like flat-panel detectors, dose-reduction technologies, 3D imaging capabilities, and robotic-assisted navigation to enhance precision, improve patient outcomes, and reduce radiation exposure for both patients and clinicians. Unlike conventional diagnostic X-ray equipment, interventional systems prioritize dynamic imaging, workflow integration, and adaptability to complex clinical scenarios, positioning them as essential tools in hybrid operating rooms, cath labs, and specialized interventional suites across cardiology, radiology, neurology, and oncology disciplines.

The global Interventional X Ray Device market size was estimated at USD 6450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
