Abstracts

An Intradermal Needle-free Vaccination Device for animals is a technology designed to administer vaccines without the use of traditional needles. It works by delivering the vaccine into the dermal layer of the skin using a high-pressure mechanism or microjet system, which creates a controlled force to push the vaccine through the skin. This method is less invasive, reducing the risk of infection and discomfort compared to conventional injection methods. It is particularly beneficial for animal vaccinations, as it can enhance the ease of administration, improve animal welfare, and potentially reduce the cost and time associated with traditional needle-based vaccination methods.

The global Intradermal Needle-free Vaccination Device market size was estimated at USD 74.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
