Abstracts

The Intradermal Needle-free Vaccination System is a medical device designed to administer vaccines without the use of traditional needles. It uses a high-pressure jet to deliver the vaccine directly into the skin (the intradermal layer) rather than through muscle or fat. This system is typically more comfortable for patients, reduces the risk of needle-related injuries, and can improve vaccination efficiency by targeting the skin's immune cells. The needle-free technology is often used for both human and animal vaccinations, offering a less invasive and potentially more cost-effective alternative to conventional needle-based methods.

The global Intradermal Needle-free Vaccination System market size was estimated at USD 74.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
