## Abstracts

An intra-gastric balloon is a non-surgical weight-loss medical device used to treat obesity. It is inserted into the stomach using an endoscopic procedure and then inflated with saline or gas to occupy part of the stomach's volume. This helps reduce food intake, increase satiety, and assist patients in managing their weight. Intra-gastric balloons are typically made of silicone or polyurethane and come in either adjustable or fixed-volume types. They are recommended for obese patients who struggle to lose weight through diet and exercise, and they are generally removed after 6 to 12 months. Compared to surgical weight-loss methods such as gastric bypass or sleeve gastrectomy, intra-gastric balloons offer advantages like being minimally invasive, reversible, and requiring shorter recovery times. However, they may cause side effects such as nausea, vomiting, and abdominal discomfort. The global market for intra-gastric balloons is growing, driven by rising obesity rates and increasing demand for non-surgical weight-loss solutions.

The global Intra-gastric Gas Balloon and Liquid Balloon market size was estimated at USD 128.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
