Abstracts

Intramedullary hip nails are specialized orthopedic devices designed for the internal fixation of proximal femur fractures, particularly intertrochanteric and subtrochanteric fractures, through insertion into the medullary canal of the femur. These implants provide stable fracture alignment, facilitate early weight-bearing, and promote bone healing by acting as load-sharing constructs, often featuring integrated locking screws or helical blades to enhance rotational stability and reduce the risk of implant failure or cut-out. Modern designs incorporate materials such as titanium or stainless steel, and may include features like cephalomedullary fixation, which allows for controlled collapse at the fracture site to improve contact and healing, making them a preferred option over extramedullary devices like sliding hip screws in cases with unstable fracture patterns or osteoporotic bone.

The global Intramedullary Hip Nails market size was estimated at USD 635.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
