Abstracts

Intraocular antihypertensive agents are a class of pharmaceutical products specifically designed to reduce elevated intraocular pressure (IOP), a primary risk factor in the development and progression of glaucoma and other ocular hypertensive conditions. These agents function through various pharmacological mechanisms, including enhancing aqueous humor outflow, reducing its production, or both, and are administered topically as eye drops or, in some advanced formulations, as sustained-release implants or injectables. The market encompasses both branded and generic medications, with key drug classes comprising prostaglandin analogs, beta-blockers, alpha agonists, carbonic anhydrase inhibitors, and rho kinase inhibitors, often used in combination therapies to achieve synergistic IOP-lowering effects.
