Report Overview:

An intraoral 3D scanner is a type of scanner that is designed to scan the inside of a mouth to acquire a three-dimensional (3D) image of teeth and other dental structures. It is a non-invasive, high-precision dental equipment used for diagnosis, treatment planning, and other dental practices.

Intraoral 3D scanners use various technologies to acquire the 3D image, including structured light scanning, confocal microscopy, and stereophotography. They work by projecting patterns of light onto the teeth or other dental structures and then capturing the reflection using a camera or sensor. The scanner then uses algorithms to reconstruct the 3D geometry of the dental structures based on the patterns of light reflection.

The Global Intraoral 3D Scanner Market Size was estimated at USD 384.79 million in 2023 and is projected to reach USD 603.87 million by 2029, exhibiting a CAGR of 7.80% during the forecast period.
