Abstracts

Intraoral imaging systems are digital diagnostic tools used in dentistry to capture high-resolution images of teeth, gums, and oral structures directly inside the patient's mouth, replacing traditional film-based X-rays with sensors or phosphor plates that instantly transfer images to computer software for analysis, treatment planning, and patient education. The global market is experiencing steady growth, driven by the increasing adoption of digital dentistry, rising demand for early and accurate diagnosis, and the integration of advanced features such as 3D imaging, artificial intelligence for automated detection, and seamless compatibility with practice management software. Key market segments include sensors (CCD/CMOS), photostimulable phosphor plates (PSP), and complementary software solutions, with North America and Europe currently leading in adoption due to well-established healthcare infrastructure and higher dental expenditure, while Asia-Pacific shows the fastest growth potential owing to expanding dental tourism, rising disposable incomes, and growing awareness of oral health. Competitive dynamics are shaped by technological innovation, with leading players focusing on enhancing image quality, reducing radiation exposure, improving ergonomics, and offering wireless connectivity, while cost sensitivity among smaller practices and the need for training and integration remain notable challenges.

The global Intraoral Imaging Systems market size was estimated at USD 1245.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
