Report Overview

Intraoral scanners are digital devices used in dentistry to capture highly accurate 3D images of a patient's teeth, gums, and oral structures, replacing traditional physical impressions. These handheld devices utilize optical scanning technology, such as confocal microscopy or structured light, to create precise digital models for applications like crowns, bridges, aligners, and implants. The market has grown significantly due to increasing demand for efficient, patient-friendly dental procedures, advancements in CAD/CAM technology, and the shift toward digital workflows in dental practices. Key drivers include the rising adoption of cosmetic dentistry, orthodontics, and restorative treatments, as well as the need for faster turnaround times and improved accuracy in prosthetic fabrication. Leading manufacturers like 3Shape, Align Technology (iTero), Dentsply Sirona, and Planmeca dominate the market, with continuous innovation in scanning speed, software integration, and AI-assisted diagnostics. However, high costs and the need for practitioner training remain barriers to widespread adoption, particularly in emerging markets. The global intraoral scanner market is projected to expand further as teledentistry grows and as dental clinics increasingly invest in digital solutions to enhance operational efficiency and patient care.

The global Intraoral Scanners market size was estimated at USD 482.33 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 16.46% during the forecast period.
