## Abstracts

Intrauterine contraceptive device (IUD) is a T-shaped, small-sized, birth control device that is inserted into woman's uterus to prevent pregnancy. These devices are highly effective, economical, and safe birth control devices. IUDs are considered 99% safe in preventing pregnancy. The contraceptive effect of IUDs is attributable to the localized inflammation that occurs after insertion. The inflammatory reaction in the uterus produces substances that are poisonous for sperms. This affects fertilization. Intrauterine devices can be used immediately after delivery, as they do not affect breastfeeding. These can also be used after abortion. IUDs provide several advantages. They prevent pregnancy for a long time; reduce the chances of ectopic pregnancy; and do not cause discomfort during sex. Once an IUD is removed, the user can quickly return to fertility.

The global Intrauterine Contraceptive Devices IUCD market size was estimated at USD 3415.49 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.20% during the forecast period.
