Abstracts

Intravenous antibodies, also known as intravenous immunoglobulins (IVIG), are sterile, purified antibody preparations derived from pooled human plasma and administered directly into the bloodstream to modulate or supplement the immune system. They are primarily used to treat a range of conditions, including primary and secondary immunodeficiencies, autoimmune disorders like Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy, and certain inflammatory or infectious diseases. The product functions by providing passive immunity, neutralizing pathogens, and regulating immune responses through mechanisms such as Fc receptor blockade and complement inhibition. IVIG therapies are categorized as biologic drugs and require strict manufacturing standards to ensure safety, purity, and potency, given their biological origin and the risk of transmission of blood-borne pathogens.

The global Intravenous Antibodies market size was estimated at USD 5184.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
