Abstracts

Intravenous anticoagulants are pharmaceutical agents administered directly into the bloodstream to prevent or treat blood clot formation by inhibiting specific coagulation factors, primarily targeting thrombin or Factor Xa, and are commonly used in acute clinical settings such as during surgeries, for deep vein thrombosis, pulmonary embolism, or in patients with acute coronary syndromes where rapid and precise anticoagulation is critical. These drugs, which include unfractionated heparin, low molecular weight heparins like enoxaparin, and direct thrombin inhibitors such as argatroban or bivalirudin, are characterized by their immediate onset of action, short half-lives allowing for tight control, and the necessity for careful monitoring to balance efficacy with bleeding risks, making them indispensable in hospital and emergency care for managing thrombotic events.

The global Intravenous Anticoagulants market size was estimated at USD 7140.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
