Report Overview

Intravenous Immunoglobulin (IVIg) is a blood-derived therapeutic product containing pooled immunoglobulins (antibodies) from thousands of healthy donors, used to treat a variety of immune-mediated and inflammatory conditions, including primary and secondary immunodeficiencies, autoimmune diseases (such as Guillain-Barré syndrome and chronic inflammatory demyelinating polyneuropathy), and certain neurological disorders. IVIg works by modulating the immune system, providing passive immunity, and suppressing harmful inflammatory responses. Due to its broad therapeutic applications, IVIg is a critical treatment in hematology, neurology, and immunology, often administered in hospitals or specialized infusion centers under medical supervision. The product's complexity, stringent manufacturing requirements, and reliance on plasma donations contribute to its high cost and limited supply, making it a high-value biologic within the global pharmaceutical market.

The global Intravenous Immunoglobulin IVIg market size was estimated at USD 11594.19 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.96% during the forecast period.
