Abstracts

An invasive glucose sensor is a medical device designed to monitor blood glucose levels by being inserted directly into the body, typically into the subcutaneous tissue. These sensors work by continuously measuring the glucose concentration in the interstitial fluid, providing real-time data that can be critical for managing conditions like diabetes. The sensor is connected to a transmitter that sends the glucose readings to a monitoring device or smartphone app, allowing patients and healthcare providers to track glucose levels throughout the day. The invasive nature of the sensor ensures more accurate and consistent readings compared to non-invasive methods, though it requires regular replacement and careful management to prevent infection or irritation at the insertion site.

The global Invasive Glucose Sensor market size was estimated at USD 4937.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
