## Abstracts

Invasive species management refers to the systematic and coordinated efforts aimed at preventing, controlling, and eradicating non-native organisms that cause or are likely to cause harm to the environment, economy, or human health. These activities include risk assessment, early detection and monitoring, biological, chemical, and mechanical control methods, habitat restoration, public education, and regulatory enforcement, all designed to mitigate the ecological and socioeconomic impacts of invasive flora and fauna. The market for invasive species management is driven by increasing globalization, climate change, and heightened awareness of biodiversity loss, with demand spanning government agencies, conservation organizations, agricultural sectors, and private landowners. Key market segments include aquatic and terrestrial invasive plant management, insect and pathogen control, and biosecurity services, supported by a growing regulatory framework and technological advancements in detection and treatment methods. Major players range from specialized environmental service firms and research institutions to equipment manufacturers and chemical suppliers, with significant growth opportunities in integrated pest management (IPM) solutions, data analytics for predictive modeling, and public-private partnerships aimed at large-scale eradication projects.

The global Invasive Species Management market size was estimated at USD 1550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
