Report Overview

The inverted bucket steam traps have a bucket that is attached by a lever with the trap. The lever is responsible for sensing the bucket's motion and close and open the trap valve in accordance with it. When the inverted bucket is surrounded by the condensate on the outside and air or steam flow from the bottom, the bucket becomes buoyant and rises due to the steam. In this condition, the inverted bucket forces the trap valve to close. A small at the top off the inverted bucket, known as vent hole is the place where small amount of pressure can be released.

The gas and oil industry is estimated to be responsible for the growth of Inverted Bucket Steam Trap Market in the forecast period 2018 to 2023 owing to the huge investments in the gas and oil fields and also to the growing concern for energy management solutions. The growth in the Inverted Bucket Steam Trap Market can be attributed to factors such as stringent policies and regulations to decrease carbon footprint led by the government and increased adoption of the inverted bucket steam traps by the end-user industries for the purpose of increasing their fuel savings.
