Report Overview

Iodine-131 is a radioactive isotope of iodine that is widely used in nuclear medicine for diagnostic and therapeutic purposes. It is commonly used in the treatment of thyroid cancer and hyperthyroidism, as well as in imaging studies to diagnose various medical conditions. Iodine-131 works by emitting beta particles that target and destroy thyroid cells, making it an effective treatment option for thyroid-related disorders. Due to its short half-life of about 8 days, it delivers a high dose of radiation to the target tissue while minimizing exposure to surrounding healthy tissues. The use of Iodine-131 in medicine is strictly regulated to ensure patient safety and proper disposal of radioactive waste.

The market for Iodine-131 is driven by the increasing prevalence of thyroid disorders, such as thyroid cancer and hyperthyroidism, which require diagnostic and therapeutic interventions. The growing awareness among healthcare professionals and patients about the benefits of nuclear medicine procedures is also contributing to the demand for Iodine-131. Additionally, technological advancements in nuclear medicine imaging and treatment modalities are further fueling market growth. The rising investments in healthcare infrastructure, particularly in emerging economies, are expected to create opportunities for market expansion. However, stringent regulatory requirements and concerns regarding radiation exposure may pose challenges to market growth.
