Report Overview

Ion beam deposition technology is a method of forming high purity solid film on a substrate by the process of irradiating a low energy and mass separated ion beam in an ultrahigh vacuum environment. Through ion beam deposition technology, secondary particles that are emitted from a sputtering target are deposited as a thin layer on a substrate by utilizing a geometrical arrangement which is specially designed for the process. This technology helps to obtain ultra-precise, high purity and thin film layer devices having maximum uniformity. Some of the common materials that are deposited onto a substrate by utilizing this technology includes various oxides such as Ta₂O₅, Al₂O₃, TiO₂ and SiO₂. Other, materials such as LaF₃, MgF₂, ZrO₃, Nb₂O₅, HfO₂, Y₂O₃ and YF₃ among others can also be deposited by utilizing an assisted and/or reactive ion beam sputtering. The list also includes material such as VOX that requires very definite control of process gas ratios in order to allow very distinct thermo electrical properties that is to be achieved for various sensitive thermal imaging processes.

The global Ion Beam Based Deposition market size was estimated at USD 635 million in 2023 and is projected to reach USD 1323.25 million by 2032, exhibiting a CAGR of 8.50% during the forecast period.

North America Ion Beam Based Deposition market size was estimated at USD 190.45 million in 2023, at a CAGR of 7.29% during the forecast period of 2024 through 2032.
