Report Overview

Ion beam etching equipment is a device that uses high-energy ion beams to perform micro-nano processing on solid materials. The principle is to fill inert gases such as argon into the ion source discharge chamber and ionize it to form plasma. The ions are then drawn out and accelerated by the grid in beam form. The ion beam with a certain energy enters the studio, shoots toward the solid surface, collides with the atoms on the solid surface, and causes the material atoms to sputter, thereby achieving the etching purpose.

The global Ion Beam Etching Equipment market size was estimated at USD 983 million in 2023 and is projected to reach USD 2048.43 million by 2032, exhibiting a CAGR of 8.50% during the forecast period.
