Abstracts

Ion beam etching equipment is a device that uses high-energy ion beams to perform micro-nano processing on solid materials. The principle is to fill inert gases such as argon into the ion source discharge chamber and ionize it to form plasma. The ions are then drawn out and accelerated by the grid in beam form. The ion beam with a certain energy enters the studio, shoots toward the solid surface, collides with the atoms on the solid surface, and causes the material atoms to sputter, thereby achieving the etching purpose. Ion beam etching equipment plays an important role in the field of semiconductor manufacturing, especially in processes such as thin film deposition and sensitization, which is used to improve the performance and reliability of semiconductor devices. The application of ion beam etching equipment in the fields of optical thin films and nano-processing is gradually increasing, becoming an important tool to promote scientific research and new material development. The application of ion beam etching equipment in the field of biomedicine is also increasing, such as in cell research, protein analysis and other fields to promote the progress of life science research. In addition, with the continuous advancement of science and technology, the technology of ion beam etching equipment is also constantly innovating. New technologies and processes are constantly being introduced into ion beam etching equipment, which improves the performance and efficiency of the equipment. In summary, the ion beam etching equipment market will continue to maintain a steady growth trend in the next few years.

The global Ion Beam Etching Equipment market size was estimated at USD 1018.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
