## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ion Beam Figuring Machine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global sales of Ion Beam Figuring Machine reached approximately 420 units, with an average market price of about USD 1.2 million per unit, an annual production capacity of roughly 500 units, and an industry-average gross margin of approximately 32%. An ion beam figuring machine is a piece of equipment that uses accelerated ion beams to bombard or sputter a workpiece surface, achieving ultra-high-precision shape correction or surface modification. It is typically used in ultra-precision optical mirror manufacturing, astronomical/space telescope primary mirror figuring, semiconductor wafer back-end processing, and high-end material surface micro-structuring. Its operating principle involves operating in a vacuum, precisely targeting ion beams under computer control to remove material layer by layer until achieving nanometer- or sub-nanometer-scale surface accuracy. Given its complex processing, high technical demands, high unit cost and long service/support cycle, it is a key piece of equipment in high-end manufacturing. In the supply chain, the upstream includes ion source suppliers (e.g., argon, krypton ion sources), beam-control systems, vacuum chambers and precision motion table component vendors; the downstream consists of optical mirror manufacturers, telescope builders, semiconductor wafer fabs and high-end material-processing firms. In terms of cost structure, raw materials (ion source, vacuum component, positioning table) account for about 45%, R&D and manufacturing labour about 25%, equipment depreciation and test-verification about 20%, with the remainder allocated to after-sales service and logistics. Downstream consumption varies by application, but a typical telescope-mirror-processing machine may handle around 5 m<sup>2</sup> of mirror surface per unit per year, while a semiconductor-backend scenario may

service about 100 wafers per day.

The global Ion Beam Figuring Machine market size was estimated at USD 504.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
