Abstracts

Ion getter pumps (IGPs) are high-vacuum pumps that operate without moving parts, relying on the principles of ionization and chemical gettering to remove gas molecules from sealed environments; they work by ionizing gas atoms and molecules using a high-voltage discharge and then accelerating these ions toward a titanium cathode, where they become embedded or react to form stable compounds, while simultaneously, fresh titanium is continuously sputtered from the cathode to coat internal surfaces, acting as a passive getter that adsorbs active gases through chemical reaction, making IGPs particularly effective for achieving and maintaining ultra-high vacuum conditions in applications where oil-free, vibration-free, and quiet operation is essential.

The global Ion Getter Pumps (Igps) market size was estimated at USD 210.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
