Abstracts

The ionization chamber is electrical device that detects various types of ionizing radiation. The voltage of detector is adjusted so that the conditions correspond to the ionization region. The voltage is not high enough to produce gas amplification (secondary ionization). Detectors in the ionization region operate at a low electric field strength, selected such that no gas multiplication takes place. The charge collected (output signal) is independent of the applied voltage and for single minimum-ionizing particles tends to be quite small and usually require special low-noise amplifiers for attaining efficient operating performance. Ionization chambers are preferred for high radiation dose rates because they have no ?dead time?, a phenomenon which affects the accuracy of the Geiger-Mueller tube at high dose rates. The industry"s leading manufacturers are Centronic, PTW and Standard Imaging (Exradin), with revenue ratios of 19.04%, 17.58% and 9.47%, respectively, in 2019.

The global Ionisation Chamber market size was estimated at USD 119.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
