## Abstracts

Ionizing radiation X-ray bone densitometer works by sending two low-dose X-rays which are absorbed differently by bones and soft tissues. The density profiles from these X-rays are used to calculate bone mineral density. The lower the density, the greater the risk of fracture. North America has higher life expectancy, resulting in a higher proportion of the population aging. The elderly population continues to grow, and the elderly population is increasingly prone to bone-related problems. As we age, bones become fragile and the risk of osteoporosis increases. After age 30, bone formation slows down and people lose a little bit of bone mass every year. Additionally, the thickness of your bones determines the severity of osteoporosis. The global healthcare industry is dominated by North America and the rising prevalence of osteoporosis has further boosted the growth prospects of the analyzed market. Innovative technologies for bone densitometry, highly developed infrastructure, large availability of new bone densitometer products, improvements in diagnostic and therapeutic procedures, etc. are driving the market growth.

The global Ionizing Radiation X-Ray Bone Densitometers market size was estimated at USD 1019.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
