Report Overview

Ionomer Resin is a polymer that comprises repeat units of both electrically neutral repeating units and a fraction of ionized units (usually no more than 15 mole percent) covalently bonded to the polymer backbone as pendant group moieties. This means that most Ionomer Resins are copolymers of the neutral segments and the ionized units, which usually consist of carboxylic acid groups. The classification of a polymer as an Ionomer Resin depends on the level of substitution of ionic groups as well as how the ionic groups are incorporated into the polymer structure. Ionomer Resins have unique physical properties including electrical conductivity and viscosity—viscosity in Ionomer Resin solution increases with increasing temperatures. Ionomer Resins also have unique morphological properties as the non-polar polymer backbone is energetically incompatible with the polar ionic groups. As a result, the ionic groups will microphase separate into ionic-rich domains in most Ionomer Resins.

The global Ionomer Resin market size was estimated at USD 750.50 million in 2023 and is projected to reach USD 1031.78 million by 2032, exhibiting a CAGR of 3.60% during the forecast period.
