Abstracts

The IoT-Based Solar Power Monitoring System is a comprehensive solution for real-time monitoring, intelligent control, and remote management of solar power generation systems using wireless sensor networks, cloud computing, and data analysis technologies. The system uses various sensors deployed on solar panels, inverters, battery banks, and distribution lines to collect real-time data on power generation efficiency, equipment operating status, environmental parameters, and energy output. This data is transmitted to a cloud platform via IoT communication protocols such as NB-IoT, LoRaWAN, or 4G/5G. Once the data is stored and analyzed in the cloud, users can view real-time information such as power generation, system health, fault alerts, and revenue statistics via a web or mobile app. The system also supports remote control of inverter startup and shutdown, output power adjustment, and other operations. This system can significantly improve the operational and maintenance efficiency of solar power systems, enabling fault prediction and intelligent diagnosis, optimizing power generation efficiency, and reducing manual inspection costs. Ultimately, it will help achieve refined and intelligent energy management for photovoltaic power plants, household photovoltaic systems, and off-grid systems.

The global IoT Based Solar Power Monitoring System market size was estimated at USD 104.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
